

Ecotrim[®]

Cream

Description

Ecotrim cream is a soft white cream containing 1% Econazole Nitrate BP and 0.1% Triamcinolone Acetonide BP.

Indications

Econazole Nitrate is a broad spectrum antifungal agent. It is effective against various dermatophytes, yeasts and moulds. Moreover, it has activity against Gram-positive bacteria. Triamcinolone Acetonide is a potent corticosteroid with anti-inflammatory, antipruritic and antiallergic activity.

The more important indications of Ecotrim are dermatomycosis caused by dermatophytol yeast and fungus with clear inflammatory and allergic symptoms such as various eczematous mycosis, diaper dermatitis, eczema marginatum, intertrigo, folliculitis, trichophytica and sycosis barbae. Ecotrim is also indicated for the treatment of mycosis present in various folds of the body.

Dosage and Administration

The cream should be applied by gently rubbing into the skin with the finger once or twice daily for 14 days or as directed by a registered physician.

Contraindications

Like all preparations containing corticosteroids, Ecotrim cream should not be used on tubercular skin infections or in viral diseases (e.g., herpes, vaccinia, and varicella).

Precautions

Long term continuous steroid therapy should be avoided since adrenal suppression can occur, particularly when infants or children are treated or when occlusive dressings are applied. Discontinuation of the medication is advised if hypersensitivity occurs.

Side Effects

Ecotrim cream is well tolerated, even to sensitive skin. Burning sensation, pruritis and redness of skin have rarely been reported.

Use in Special Population

Pregnancy : The use of corticosteroids during pregnancy has not been established. Topical steroids should not be used extensively in pregnancy, i.e. in large amounts or for prolonged periods.

Commercial Pack

Ecotrim[®] Cream : Tube containing 10 g cream, each gram contains Econazole Nitrate BP 10 mg and Triamcinolone Acetonide BP 1 mg.
